

#### Opposite Rays:

If you choose a point on a line, that point determines exactly two rays called **opposite** rays. Since both rays share a common endpoint, opposite rays are collinear

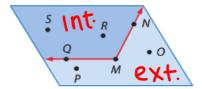

# Angle: formed by 2 noncollinear rays that have a common endpoint.

#### Interior vs. Exterior

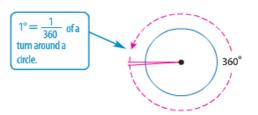

An angle divides a plane into three distinct parts.

- Points Q, M, and N lie on the angle.
- Points *S* and *R* lie in the **interior** of the angle.
- Points *P* and *O* lie in the **exterior** of the angle.

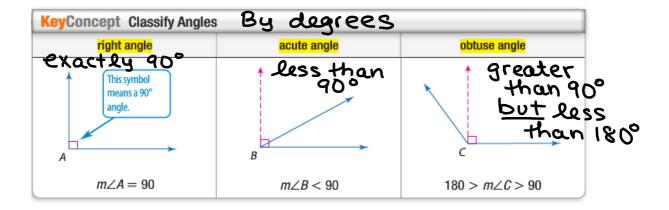

#### **Degrees**

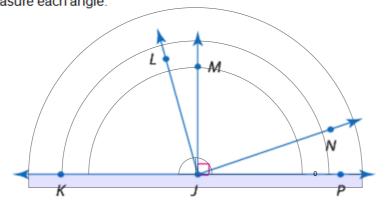

Angles are measured in units called degrees. The **degree** results from dividing the distance around a circle into 360 parts.

#### **Classifying Angles**

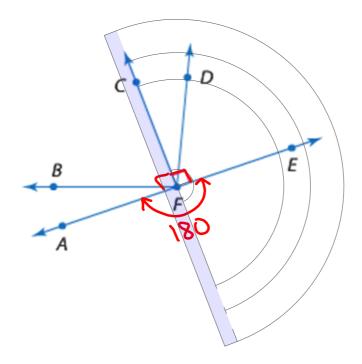

examples 1a and 1b: Classify each angle as right, acute, or obtuse. Then use a protractor to measure each angle.

example 1a)

ZNJP <u>right 90°</u>
ZLJP <u>obtuse 105°</u>
ZNJP <u>acute 19°</u>

example 1b)

LAFB acute 19°

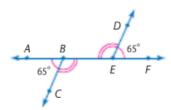

ZCFA <u>right 90°</u> ZAFD <u>obtuse 11</u>5°

ZCFD acute 27°

#### **Congruent Angles**

**Congruent Angles** Just as segments that have the same measure are congruent segments, angles that have the same measure are *congruent angles*.

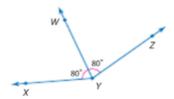

In the figure, since  $m \angle ABC = m \angle FED$ , then  $\angle ABC \cong \angle FED$ . Matching numbers of arcs on a figure also indicate congruent angles, so  $\angle CBE \cong \angle DEB$ .

You can produce an angle congruent to a given angle using a construction.

### StudyTip Segments A line segment can also bisect an angle.

A <u>ray</u> that divides an angle into two congruent angles is called an <u>angle bisector</u>. If  $\overrightarrow{YW}$  is the angle bisector of  $\angle XYZ$ , then point W lies in the interior of  $\angle XYZ$  and  $\angle XYW \cong \angle WYZ$ .

Just as with segments, when a line, segment, or ray divides an angle into smaller angles, the sum of the measures of the smaller angles equals the measure of the largest angle. So in the figure,  $m \angle XYW + m \angle WYZ = m \angle XYZ$ .

## Angle Addition Postulate

examples:

ALGEBRA In the figure,  $\overrightarrow{KJ}$  and  $\overrightarrow{KM}$  are opposite rays and  $\overrightarrow{KN}$  bisects  $\angle JKL$ . If  $m\angle JKN = 8x - 13$  and  $m\angle NKL = 6x + 11$ , find  $m\angle JKN$ .

2)

$$\angle JKN \stackrel{\frown}{=} \angle NKL$$
 $M \angle JKN = M \angle NKL$ 
 $8X - 13 = 6X + 11$ 
 $-6X + 13 = 6X + 13$

**3.** Suppose  $m \angle JKL = 9y + 15$  and  $m \angle JKN = 5y + 2$ . Find  $m \angle JKL$ .

$$m \leq JKL = 9y + 15 \text{ and } m \geq JKN = 5y + 2. \text{ Find } m \geq JKL.$$

$$m \leq JKN = \frac{1}{2}m \leq JKL$$

$$2(5y+2) = 9y+15$$

$$= 9y+15$$

$$= 9y+15$$

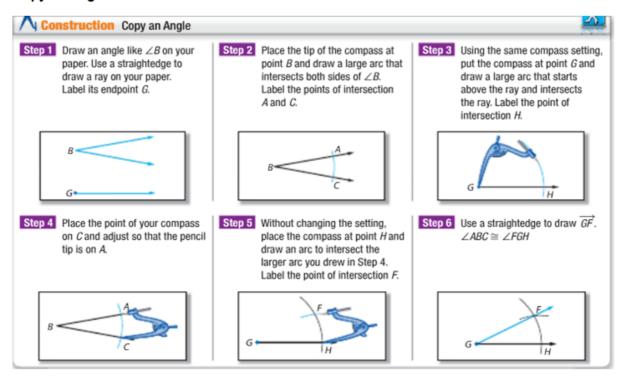

$$= 9y+15$$

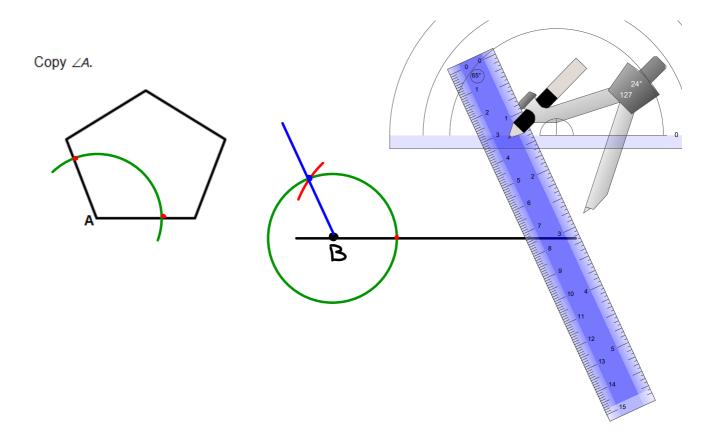

$$= 10y+4 = 9y+15$$

$$= 114$$

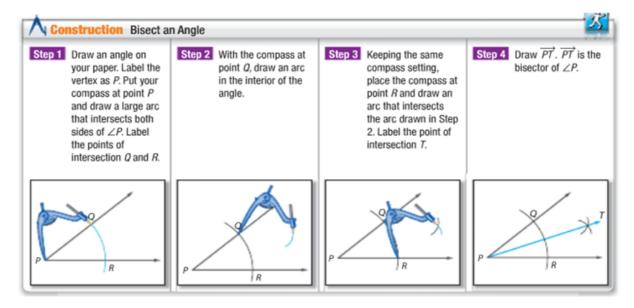

$$y = 11$$
